Benefits to your Guest

- Security: Each new guest will have a new guest key.
- Each new keycard means a new lock.
- Convenience: No mechanical/hard keys to carry.
- Anti-panic function.
- Real privacy "Do Not Disturb" function.
- Electronic In-Room safes for the highest security and comfort for your guest.
- The widest range of accessories to match your internal decor.

General

- Designed for any hotel property size
- PC based system
- User friendly: easy to learn, easy to use
- Direct interface with any PMS or POS system
- Allows Multi-Front-Desk configuration: links as many check-in terminals as needed without requiring additional PC's
- Exclusive OmniMaster Masterkeying system: up to 600 different types of master keys assigned to users by name
- Provides staff shift time tables
- Compatibility to control full range of TESA options: room safes, energy saving devices, on-line and off-line card readers, card identifiers
- Works with the full variety of TESA stand-alone locks
- Worry-Free Guarantee Worldwide

Education

Colleges are entrusted with an awesome responsibility: to provide a safe and positive environment for higher education. It's no surprise that safety weighs almost as heavily as curriculum for parents when considering a college for their child.

There has been a paradigm shift in how administrators define and implement campus security. Traditional keys and locks do not provide an adequate level of security to ensure the safety of life or property, because keys can be easily copied. Each secured door is independently responsive according to time, date and individual cardholder.

Campus-wide electronic access control is the only logical solution to dramatically increase security and decrease lock maintenance costs, while offering the flexibility needed to support the constantly changing campus environment. TESA has an electronic access management system designed to protect your entire campus.

Government

There are two inherent security problems with traditional metal key systems: Keys can be duplicated and reissuing of keys or re-keying locks is time-cost prohibitive. There is no way to control the time or date that a cardholder can access an area with conventional keyed locks.

From a security perspective, this is Russian roulette; from a maintenance standpoint, this is a losing battle of wasted dollars. What was once only approved for higher security and intelligence operations is now a cost-effective management tool for all government/military installations. A facility-wide electronic access management system is the only logical solution to dramatically increase security and decrease lock maintenance tools.

TESA engineers can present to your base, barracks, ship or offices an all-area or perimeter access management system that requires no wiring between doors and can withstand whatever nature throws at it. Each secured door is independently controlled by time, date and individual cardholder (officer or enlisted, maintenance staff, visitor or conference attendee).

Commercial

Proactive security management is essential in these changing times. Businesses today are faced with ever-increasing exposure to liability from workplace incidents, pilferage and information leaks. The unsettling fact is that keys used to protect and secure can be easily duplicated without your knowledge.

Until now, access management systems have been cost prohibitive for large facilities with a multitude of doors to monitor. Facility-wide access management is the only logical solution to dramatically increase security and decrease lock maintenance costs. TESA develops electronic access management systems to protect your entire corporate campus.

TESA can provide your corporation an access management system that requires no wiring between doors. Each secured door is independently controlled by time, date and individual cardholder. Beyond the inherent security benefits, electronic access management instills a higher level of comfort for employees and potential business partners.

Healthcare

Healthcare administrators have to contend with a unique set of security management issues. Inside healthcare facilities are a great volume of patients and/or residents, a large employee base with frequent staff turnover and dozens of restricted areas. To compound the problem, hospitals and managed healthcare facilities have to maintain tight inventory and pharmaceutical control often based more on an internal cancer than external threat.

Until now most facilities had to rely on traditional locks with metal keys that can be easily duplicated. This type of mechanical lock is costly to maintain and unfortunately, the locks are usually changed "after the fact" -- when management realizes a loss of property or when an incident occurs.

To effectively manage multiple buildings and large staffs with many levels of security authorization as well as patients or residents with varying abilities and needs, the healthcare industry has turned to TESA for the solution.

A facility wide access management system that does not require wiring between secured doors is the only logical solution to dramatically increase security and decrease lock maintenance costs. Each secured door is independently responsive according to time, date and individual cardholder.

The TESA HT28-Smart Lock:
Built today with tomorrow in mind

- Full Interoperability**
HT28-SMART supports a wide range of smart cards simultaneously
- Multi-Technology Reader**
Allows for smooth technology transitions
- Enhance Your Property's Image**
Customize your locks by adding your logo or a design
- Automatic Reset After Entry**
Protects your guests while protecting your property from liability
- Audit Trail**
Records the last 500 transactions to protect you from liability
- Auto Deadbolt**
Whether your guest is in or out of the room, you will always receive the added protection of a deadbolt
